ARTIFICIAL INTELLIGENCE

Khon Kaen University · 2026

Final Week

Final Project Guideline

Teaching a Model to Read Pictures

Six tasks, one shared recipe: classify, detect (box & rotated box), segment, estimate depth, and find pose — all with the same train → predict → evaluate loop.

Instructor: Teerapong Panboonyuen (P'Kao)

Build a Complete AI Project — Your Way

Every student team designs, builds, and presents an original AI project that connects to what we've covered this semester — from feature engineering to computer vision and modern foundation models.

**11 weeks of AI, from data
to foundation models**

01

Choose Freely

Pick any AI topic you find exciting — as long as it relates to a concept taught in this course.

02

Team Up

Form a group of up to 6 students. Smaller groups are welcome too.

03

Present Live

Deliver an Oral Presentation during Final Exam week to explain and defend your work.

What You Need to Deliver

1

Pick a Topic

Any AI application that relates to topics covered in class — classification, forecasting, recommenders, computer vision, LLMs & agents, and more.

2

Form a Group

Up to 6 students per group. Register your team and topic using the provided sign-up template.

3

Build the Pipeline

Data collection/selection → preprocessing → modeling → evaluation → insight, using techniques from this course.

4

Deliver an Oral Presentation

Present your project live during Final Exam week. Date & venue announced through the course's online channel.

Grading Breakdown — 40 Points (40%)

Example split shown above — the instructor may adjust weights per topic, but the total always sums to 40 points (40%).

Bonus: +2% for Collecting Your Own Data

+2%

Collect and label your own dataset — instead of only using an existing public dataset — to earn a real +2% added directly on top of your final grade.

How the bonus can shift your grade

79% +2% → 81%

May push your grade into the next letter-grade band, e.g. from B+ toward A.

49% +2% → 51%

May be the difference between a failing and a passing final grade.

Illustrative examples only — final letter-grade bands follow the course's official grading policy.

Register Your Group & Topic

Reserve your project topic using the shared sign-up template provided with this guideline (CSV / spreadsheet). Fill in one row per team member.

1

Group Number

2

Group Name

3

Project Topic

4

Model / Task Type
(e.g. Image Classification)

5

Student Name

6

Student ID

Topics are reserved first-come, first-served — try to keep your topic distinct from other groups.

EXAMPLE

Sample Topic Registration

Here's a filled-in example — one row is added per group member.

Group No.	Group Name	Project Topic	Model Type	Student Name	Student ID
1	DataWizards	Movie Recommendation Engine	Recommender System	Somchai Jaidee	654012345
				Suda Meechai	654012346
				Anan Wongsawat	654012347

A ready-to-use CSV version of this template is provided alongside this slide deck.

Oral Presentation Format

Suggested structure for your final presentation:

- **Time per group:** Typically 10–15 minutes presentation, plus Q&A — exact timing confirmed closer to Final Week.

- **Everyone presents:** All group members should take part in delivering or answering questions.

- **Materials:** Bring slides and be ready to show your notebook / code if asked.

Timeline & Submission Checklist

Before you present, make sure you have:

- Registered your group, members, and topic
- A complete, working pipeline (data → model → evaluation)
- Slides ready for an oral presentation
- Code / notebook available in case it's requested

Good Luck With Your Final Project

“From data to intelligence — one model at a time.”
